### How I created my a registration form using HTML and CSS:

1. I set the charset to UTF-8, according to the teacher this is the most used. And then I established the title "Register here".
2. I started to code css for the background image in `<style>`. The background image is in the same folder with the index, so I simply code  
`background-image: url("bg.jpg");`
3. after the background image is implemented. I started to code a transparent form that is used in the example. I created .form as a class in `<style>` I set the border radius to 25px, width 300px and height 500px.  
I add `display: grid; place-content: center;` because I think it will look more neat. For transparency I use RGBA values. `background: rgba(255, 255, 255, 0.1);` and then I add shadow to make it darker `box-shadow: 0 26px 42px rgba(0, 0, 0, 0.1);`
4. After that I started to go to `<body>` . I add `<center>` so the text will go to the center, and then I add `<form class="form">` inside the center so everything that I type in the body will go inside the form box. after that I start put the title "Registration Form"
5. Below the title of the form I start to code  
`<label class="label" style="font-family:Sans-serif"><b>First Name</b></label>`  
`<input class="input--style-4" type="text" name="first_name"`  
`placeholder="Enter Your First Name">`  
It's the same code for last name, your age, email, and phone number text box. I just used this code 5 times, and just changed the name and the placeholder.
6. For gender, I'm trying to follow the example in the pdf, using input type radio.  
`<label class="radio-container m-r-45" style="font-family:Sans-serif">Male`  
`<input type="radio" checked="checked" name="gender">`  
`<span class="checkmark"></span>`  
same code for female input.
7. For the language, I want to try something different. I will use selection with multiple options. I saw the teacher do it before so I do it

```
<label class="label" style="font-family:Sans-serif"><b>Language</b></label>
<select name="subject">
  <option disabled="disabled" selected="selected">Select Language</option>
    <option>English</option>
    <option>Chinese</option>
    <option>Indonesian</option>
  </select>
```

8. After I did that, I think the input box doesn't look good. So I started to learn from W3School on how to make the input box more rounded using css. I coded an attribute inside the `<style>` for `input[type=text]`. I modify the input box shape, add some borders and change the border radius.
9. and for the final part is adding the submit button. I modified the button in `<style>` I modified the button to be wider and use the same code from before to make it transparent. After that I coded in the `<body><center><form>`. I put the button inside the transparent form.  
`<button type="submit" style="font-family:Sans-serif"><b>Submit</b></button>`
